

Registration & Auth Flows

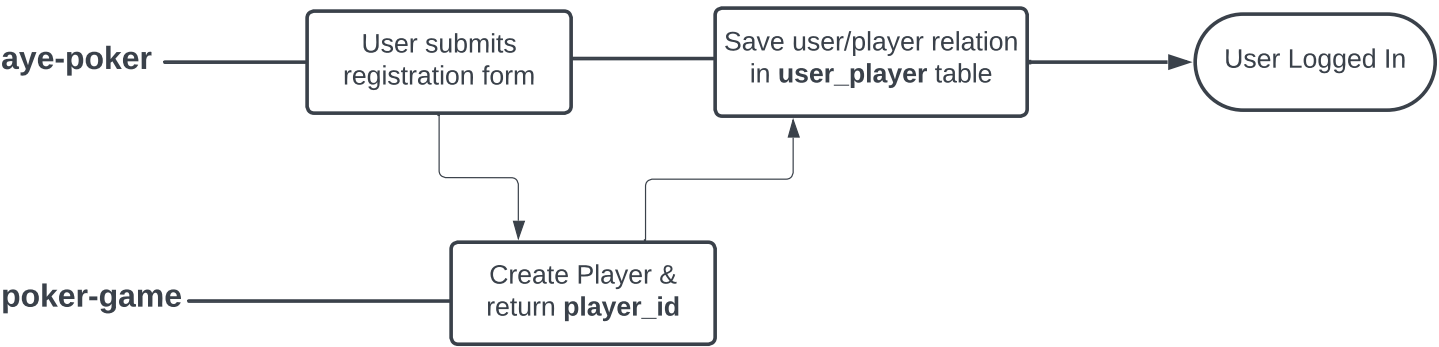

Problem: the only concept of a User exists in poker-game. The main aye-poker app has been set-up with log-in/out, this needs to be connected to the poker-game so users can create accounts and play each other.

Notes:

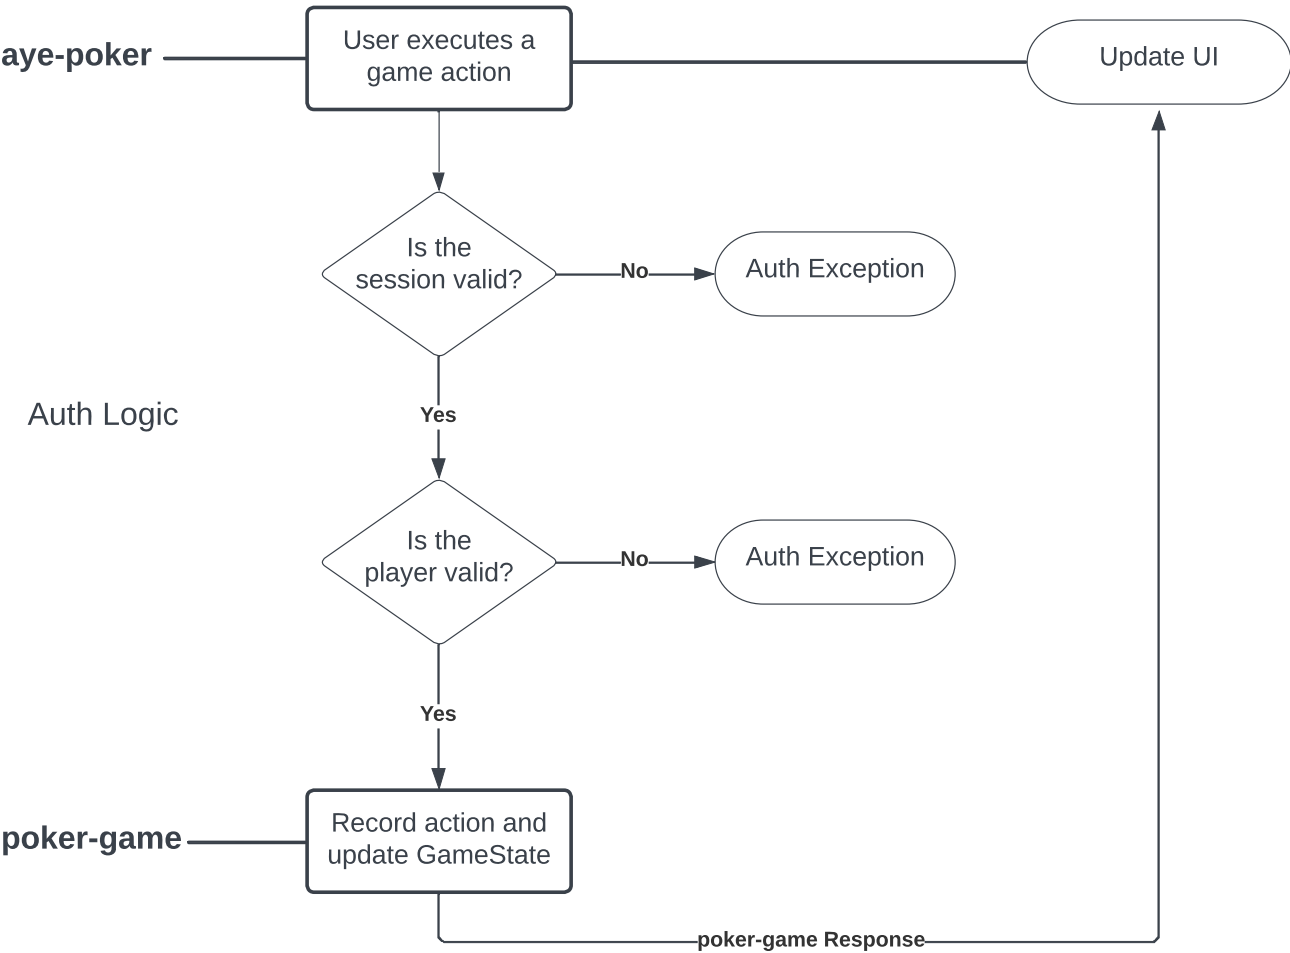

I want to keep the DBs as separate as possible. I don't think the poker-game should be aware of the User entity from Symfony. aye-poker should handle that with a user_player table, saving the player_id returned from poker-game.

However, if using poker-game as an API, I'll probably need to create the user/player link there to for protection against invalid player action requests.

Registration Flow

Authentication Flow (Player Action)

DB Representation

User [user]		
pk	id	increments
	email	email
	password	string
	is_verified	boolean

UserPlayer [user_player]		
fk	user_id	foreignId
fk	player_id	foreignId

Player [players]		
pk	id	increments
	name	varchar
